## *AC Anywhere – Instructions and Information:*

Belkin Components manufactures a line of DC to AC Inverters with 140 and 300-Watt capacities. These Inverters offer advanced technology, dependable operation and will provide years of reliable service when used in accordance with our operating instructions.

Belkin's Inverters convert low voltage, direct (DC) current to 230-volt alternating (AC) household current. Depending on the model and its rated capacity, Belkin Inverters draw power either from standard 12-volt automobile and marine batteries, or from portable, high-power 12-volt sources. The Belkin inverter can not be used with 24 volts (trucks) battery power.

### *Important Information:*

This manual will provide you with directions for the safe and efficient operation of your Belkin 140-Watt, or 300-Watt Inverter. Read the manual carefully before using your new Belkin Inverter and keep the manual on file for future reference.

### **Note:**

- *Your Belkin Inverter is designed to operate from a 12-volt power source only. Never attempt to connect your Inverter to any other power source including any AC power sources.*
- *230 volts of current can be lethal. Improper use of your Belkin Inverter may result in property damage, personal injury, or loss of life.*

### *Getting Off to a Good Start:*

In order to ensure that the capacity of your Belkin Inverter is sufficient to meet the required start up load, you must first determine the power consumption of the equipment or appliance you plan to operate.

Power consumption is rated either in wattage or in amperes. Information regarding the required "watts" or "amps" is generally printed on most appliances or equipment. If the power consumption is rated in amps, multiply the number of amps by 230 (AC voltage) to determine the comparable wattage rating. As a general rule, you can determine the *required start-up load* by multiplying the wattage rating by 20.

### *Don't Push It:*

Although your Belkin Inverter has the capacity to provide power output equal to approximately two times its rated wattage capacity for a very brief period, it is designed to operate equipment with start-up load wattage ratings no higher than its own *maximum continuous wattage rating*.

## *Installation:*

### *Power Source Requirements*

The power source must provide 12 Volts DC and must be able to supply the necessary current to operate the load. The power source may be a battery or a well-regulated 12V DC power supply. As a rough guideline, divide the power consumption of the load (in watt) by 12 (the input voltage) to obtain the current (in amperes) the power source must deliver. Example: Load is rated at 120 Watts; the power source must be able to deliver:  $(220/12) = 18.3$  Amps

### *Making the Connection:*

The Belkin 140 and 300-Watt Inverters are designed to connect to your 12-volt battery through the cigarette lighter socket on your dashboard. To connect and use these Inverters, follow these easy steps:

1. Remove the cigarette lighter and push the adapter plug firmly into the socket. Make sure both the socket and adapter plug are clean and dry.
2. Plug your appliance or equipment into the AC receptacle on the Inverter.
3. Turn the Inverter rocker switch to the ON (I) position.
4. Confirm that the LED Power Indicator light on the Inverter is glowing GREEN. This GREEN light indicates that your Inverter is "ready for action."
5. Turn on your equipment for use.

### *Don't Blow a Fuse:*

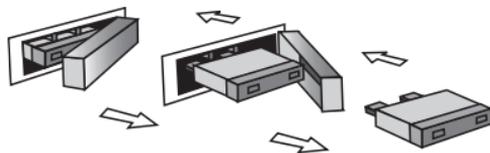

All Belkin Inverters are equipped with a spare fuse in case the original fuse should blow. Most blown fuses are the result of reverse polarity or a short circuit within the appliance or equipment being operated. With reasonable care, it should not be necessary to replace the fuse in your Inverter.

### *To Replace a Fuse:*

#### **Belkin 140-Watt / 300-Watt Inverter**

First, remove the power cord from the cigarette lighter socket. You will find fuse compartment is easily accessed at the back of the unit underneath the "lift-up" cover. Pull the blown fuse out, and insert the replacement. It is important to remember that to replace of fuse of the same type and rating as indicated. Make certain to correct the source of the overload that caused the blown fuse before turning your Inverter back ON.

1. *Open the fuse box cover*

2. *Replace the blown fuse with a new spade type fuse*

### *The Power Source:*

When the engine is off, most batteries will provide an ample power supply to the Inverter for one to two hours. The actual length of time is a function of several variables including the age and condition of the battery, and the power demand being placed on it by the equipment being operated.

If you are using the Inverter while the engine is off, we recommend you start the engine every hour and let it run for approximately 10 minutes to recharge the battery. We also recommend that the device plugged into the Inverter be turned off before turning over the engine.

Although it is not necessary to unplug the Inverter when starting the engine, the Inverter may momentarily cease operation as the battery voltage decreases. When the Inverter is not supplying power, it draws very low amperage from the battery (< 0.3 amps to < 0.4 amps depending on the model) and may be left connected to the battery for up to 3 hours. However, we recommend the Inverter always be disconnected when not in use.

### **Note:**

- *Inverters will not operate with certain automotive systems unless the ignition is on. If the Inverter is not generating power, try turning the ignition to the accessory position.*

### *Automatic Shut-down and Related Safety Features:*

The Belkin 140 and 300-Watt Inverter models have a unique LED indicator warning light system that operates in conjunction with the automatic shut down feature. This indicator light operates as follows:

GREEN - Status is Normal  
RED - Overload/Low Battery

Your Inverter will shut down automatically when any of the following problems occur:

1. The power input from the battery drops below 10.4 volts.
2. The power output from the battery exceeds 15 volts.
3. The continuous draw of the device exceeds the design parameters of the Inverter.

### *Additional Safety Features:*

1. Automatic shutdown when the internal circuit temperature exceeds standard design parameters for safe operation.
2. Continuous audible alarm:
  - a. When the input power from the 12-volt power source drops to 11 volts.
  - b. When the internal circuit temperature exceeds standard design parameters for safe operation.

In the event of automatic shut-down or continuous alarm, turn the Inverter rocker switch to the OFF (O) position until the source of the related problem has been identified and resolved.

### **Note:**

- *The Belkin 300W model is equipped with a cooling fan that is only designed to run continuously while the Inverter is operating. Automatic shutdown caused by excess circuit temperature occurs when the cooling fan is unable to maintain the design parameters for safe operation of the Inverter.*

To maintain your Inverter in proper working condition, note the following important safety precautions:

- **MOISTURE** - Keep the Inverter dry. Do not expose it to moisture.
- **HEAT** – The ambient air temperature should be between 50°F and 80°F. Avoid placing the Inverter on or near heat source. Do not place the Inverter in direct sunlight.
- **VENTILATION** – In order to disperse the heat generated while the Inverter is in operation, keep it well ventilated. While in use, maintain several inches of clearance around the top and sides of the Inverter.

*Caution: Most automobile cigarette lighter circuits use fuses rated at 10-20 Amps.*

### *Battery Direct-Connect Cables:*

*For the Belkin 300-Watt Inverter Only – F5C400u300W*

### **Note:**

- *If the equipment or appliance you intend to operate requires more than 150 Watts of continuous power, the Belkin 300-Watt Inverter should be connected directly to the power source using the Battery Direct-Connect Cables. Failure to do so may result in serious damage to the power cord or to the cigarette lighter socket wiring in your vehicle.*

To connect the Belkin 300-Watt Inverter directly to the 12-volt power source (battery), follow the steps as outlined below:

1. Push the adapter plug leading from the Inverter firmly into the Direct-Connect Cable socket.
2. Properly identify the positive (red) and negative (black) terminals on the 12-volt power source and make certain that the terminals are clean and dry.
3. Connect the RED alligator clip to the positive (+) terminal on the power source, and the BLACK alligator clip to the negative (-) terminal on the power source.
4. Plug your equipment or appliance into the AC receptacle on the Inverter.
5. Turn the Inverter's power switch to the ON position.
6. Confirm that the LED power indicator light on the Inverter is glowing GREEN. This means the Inverter is "ready for action".
7. Turn on the equipment or appliance.
